JS Test Frameworks

●●●

Ji Zhou

Jasmine VS Mocha

API

```
describe('test functionX()', function() {
     it('should ...', function(){
      // assertions here
     })
})
```

```
 Jasmine: expect().toEqual()

 Chai: expect().to.equal()
```

API

```
describe('test functionX()', function() {
    it('should ...', function(){
     // assertions here
    })
})
```

Jasmine: expect().toEqual()

Chai: expect().to.equal()

Assertion Libraries

➔ should.js
➔ express.js
➔ chai
➔ better-assert
➔ unexpected

Test Doubles

➔ Test stub
➔ Mock object
➔ Test spy (Jasmine)
➔ Fake object
➔ Dummy object

Test Doubles

➔ Test stub
➔ Mock object
➔ Test spy (Jasmine)
➔ Fake object
➔ Dummy object

Things to spy on:

- See how many times a spy was called

- Specify a return value to force your code to go down a certain path

- Tell a spy to throw an error

- See what arguments a spy was called with

- Tell a spy to call the original function (the function it is spying on). By default, a spy will not call the original function.

Asynchronous Testing

```
describe('test functionX()', function(done) {
    it('should ...', function(){
     // assertions here
     var foo = new Foo(128);
      foo.bar(done);

    })
})
```

Fake Server

Jasmine

Fake Server

Jas~~min~~

Fake Server

Jasmine

Mocha **+** Sinon

Running Tests

Mocha: command line utility

Jasmine: no inbuilt test runner (Karma is a popular runner)
